Did you know?

There are more trees in the world today than there were 100 years ago, yet there is also more paper than 100 years ago.
Between 1953 and 2006 the number of trees growing in the U.S. increased by 49%.
Today there are 12 million more acres of forestry in the U.S. than just 20 years ago.
Thermography powder and resin are made from renewable resources and thermography can be recycled!
The powder is made from the paper making process and the resin is made from Rape Seed Plants or Pine Trees.
